# 1 Strength of Materials Problem Workout

To scaffold your learning in this example, we have provided a free body diagram for you and a repeat of the problem statement.

A city planner is installing a new traffic light. Light A weighs 65 lb, while lights B and C weigh 50 lb each. The post at O has a hollow circular cross-section with an outer diameter of 5 inches and a wall thickness of 0.2 inches. Please calculate the magnitude of the maximum combined stress in the post. You may ignore the weight of the post.

Figure 1.1: Figure 1: Three traffic light installation with loads

Please work through the problem step by step showing your math in the interactive interface [here](#).

## 2 Workout Example Solution

### 2.1 Worked Out Solution

This demonstrates a worked out solution to the problem. The best way to begin is by drawing a free body diagram.

Figure 2.1: Figure 3: Three traffic light installation with loads

Use equilibrium equations to find the internal loads:

$$\begin{aligned}\Sigma F_y = 0 : N - 65 - 50 - 50 &= 0 \\ N &= 165 \text{ lbs}\end{aligned}$$

$$\begin{aligned}\Sigma M_O = 0 : -M + (50 \times 7) + (50 \times 11) + (65 \times 15) &= 0 \\ M &= 1875 \text{ lb} \cdot \text{ft} = 22500 \text{ lb} \cdot \text{in}\end{aligned}$$

Now, determine the cross-sectional properties:

$$A = \pi(r_o^2 - r_i^2) = \pi(2.5^2 - 2.3^2) = 3.02 \text{ in}^2 \quad I = \frac{\pi}{4}(r_o^4 - r_i^4) = \frac{\pi}{4}(2.5^4 - 2.3^4) = 8.70 \text{ in}^4$$

Calculate stress due to normal force:

$$\sigma_n = \frac{F}{A} = \frac{-165 \text{ } lbs}{3.02 \text{ } in^2} = -54.7 \text{ } psi$$

Calculate maximum stress due to bending moment (will have same magnitude in both tension and compression):

$$\sigma_m = \pm \frac{M_c}{I} = \pm \frac{22500 \times 2.5}{8.70} = \pm 6460 \text{ } psi$$

Determine combined tensile stress:  $\sigma_T = -54.7 + 6460 = 6410 \text{ } psi$

Determine combined compressive stress:  $\sigma_T = -54.7 - 6460 = -6520 \text{ } psi$

## 3 Summary

In summary, this book has no content whatsoever.
